Open Source does not just mean free software. As they put it in the youtube video Open Source Explained, it means freedom to use that software how you like. Open source software is used in many of the worlds most important software projects, Linux being the biggest and most well known. The source code is free to the public, so legions of passionate volunteers spend their valuable time combing through for bugs and presenting their efforts back to be added into the source code. Its both an inspiring show of collaboration, and also an effective way to develop. After all, the more eyes on a project, the more likely bugs or errors are to be spotted.

1. Open-source software allows people to view and work with the source code
2. GIMP, Blender, VLC, Audacity, and LibreOffice are examples of open-source applications
3. Linux started as a project by Linus Torvalds and eventually became widely used around the world
4. Open-source software is useful for more than coding, with programs available for things like video editing, audio production, graphic design, and 3D modeling.
5. Richard Stallman started the GNU Project, which became an important part of the free software movement
6. VLC is an example of open-source software that can play many different types of media files
7. Krita is an open-source option for digital art and painting
8. HandBrake is an open-source tool that can convert video files into different formats

I had never heard of a few of these, but there are a few I am fairly familiar with. VLC and Audacity I used quite a bit back in the day. VLC got big in the early days of peer to peer file sharing.
