What is Markdown?

1. **Markdown** is a *markup language*, used to write formatted text with a plain text editor. It uses simple grammatical symbols to interpret formatting, making code easy to read.

What is Git?

2. **Git** is an open source version control system designed to track changes during software development. It saves branching versions rather than duplicating files, as well as storing backups of current and previous versions. **Git** will allow approved users to access your code and files, implement a fork, and create their own versions or variations. These changes can be tied back into the original code, or kept separate as standalone versions.

What is Github?

3. **GitHub** functions as a *hub* for Git. It is a server with a more streamlined interface than working purely through the Git command line, allowing users to interface with Git in a more streamlined environment.

What is Slack?

4. **Slack** is a communication and organization application that allows users to perform several organizational needs all within private servers. It functions much like *Discord*, but for the more corporate user base. Uses include:
 - Communication
 - File Sharing
 - Meeting Hosting
