I chose to watch the video presented in the instructions, A Brief History of Linux by Gary Explains. It's really interesting how fast Linux exploded with where and how it could be used. Obviously, the open source model made it of interest to many people looking to get into computer technologies back in the 90's as they had access to the source code with it being fully open to customization. But for me, as someone who is going into IT, I think its most defining moment was in 1996 with the release of version 2.0. As Gary Explains says, this was huge because it included the SMP support, or symmetric multi-processing. This meant it could be run on machines with multi core processors, which in turn meant Linux could now run servers. To this day, one of the most common use cases for Linux OS distributions is running servers or cloud services. As an IT major, this is one of the biggest areas I'll be working with when I seek employment at any kind of larger company, and honestly something that I personally have a lot of interest in.

After watching the videos and podcast, I think the most important event in Linux history for computer science and IT was when Linus Torvalds made Linux free to use and share in 1992. The video, podcasts, and timeline show how Linux started as a small project and grew as people around the world helped improve it. Since the code was open, developers from everywhere could learn from it, make changes, and share their work. Linux also helped complete the GNU operating system. As the internet grew, Linux became very important for running servers and online services, and this shows how people working together can create technology that lasts.

Hello Osman. Its hard to overstate how foundational the initial release of Linux was back in 1992. It being free and open source though, was probably the biggest boost to its popularity. People in the Computer Science field are naturally curious about everything that goes into building an OS from the ground up, and the collaborative method of open source models tends to get people excited as well!
